In July 2007, Chet Morrison Contractors began the fabrication of a 7,700 long ton floating dry dock, a two year project that would mark another milestone for Morrison Energy Group. Building the structure was the biggest endeavor ever taken on at the Alvarado, Mexico yard. CMC was confident that its team members were up to the task due to the team's history of loyalty, safe performance, and high commitment to quality standards. Over 400 workers provided technical support, project engineering and manpower to safely complete the project without an OSHA recordable incident.

The construction of the dry dock, built by our own workforce, is a testament to our ability to develop a large-scale project from conception to completion. Every fitter, welder, pipefitter, and other specialty position involved with the project displayed the high degree of professionalism that is the trademark of all members of the CMC team.

The development of this project was possible due to the synergy of our integrated team. The floating dry dock will allow Chet Morrison Contractors to offer cost-effective ship and barge repairs and provide new construction solutions.

Thank to Carlos Solano and Sariel Enriquez for contributing to this story.

WHAT WAS ONCE SEEN AS A DREAM...

...IS BECOMING A REALITY.
